## PEEL STRENGTH TEST

A peel test is performed between two substrates bonded together with an adhesive. The adhesive itself will generally take the form of a thin layer between the two substrates such as the adhesive located on the underside of a piece of tape.

The goal of a peel test is to determine the adhesive strength of the material or the strength of the adhesive bond between two materials. This adhesive strength may be referred to as the "stickiness" of a material as it is a measure of the samples resistance to separation from one another after the adhesive has been applied. This measured value may then be used to determine if the adhesive bond is strong enough or too strong for the application and whether a different adhesive or bonding process is needed.

Allfasteners uses this test to compare our blue masking tape to other tapes on the market. The results showed the AF® brand tape is on average 20% stronger than the leading manufacturer of tape.
